Program 6

Insertion in B-tree

- 1) Initialize x as root
- 2) while x is not leaf, do following
 - a) find the child of x that is going to be traversed next, Let child be y .
 - b) If y is not null, change x to point y .
 - c) If y is full, split it and change x to point to one of two parts of y . If K is smaller than mid key in y , then set x as first part of y . Else second part of y . When we split y , we move a key from y to its parent x .
- 3) The loop in step 2 stops when x is leaf. x must have space for 1 extra key as we have been splitting all nodes in advance. So simply insert K to x .

$t = 3$
4) Insert 10, 20, 30, 40, 50, 60, 70, 80 & 90

1) 10

2) 10 20 30 40 50

3) Insert 60, root node is full, hence we split into 2

4) Insert 20 & 80

Insert 90, we split
